PROFESSIONAL SUMMARY

Java Backend Developer with 3 years of experience designing and building secure, scalable, and high-performance enterprise applications. Strong expertise in Spring Boot and Spring Cloud for developing modular, RESTful microservices architectures. Skilled in designing resilient, maintainable, and observable backend systems following modern software engineering principles.

- Design and build scalable backend systems using Java and Spring Boot with clean, layered architectures for maintainable enterprise applications.
- Develop and consume RESTful APIs with efficient request handling, proper HTTP methods, and structured response models for reliable inter-service communication.
- Build modular microservices that operate independently to ensure flexibility, scalability, and maintainability across distributed environments.
- Implement secure authentication and authorisation using Spring Security, JWT tokens, and role-based access control to protect REST endpoints and sensitive data.
- Integrate and optimise Hibernate/JPA for seamless interaction with MySQL and PostgreSQL databases, ensuring efficient data access and transaction management.
- Apply Resilience4j features such as Circuit Breaker, Retry, and Fallback to enhance service reliability and handle system failures gracefully.
- Implement asynchronous communication between microservices using Apache Kafka and RabbitMQ for reliable, event-driven, and decoupled system design.
- Implement global exception handling, custom error responses, and data validation for consistent and user-friendly API behaviour.
- Write and maintain unit and integration tests using JUnit and Mockito, following test-driven development (TDD) principles for higher code reliability.
- Document, test, and verify REST APIs using Swagger (OpenAPI) and Postman to ensure quality and ease of integration.
- Manage code versions with Git and GitHub, actively participate in Agile/Scrum sprints, and contribute to peer code reviews and retrospectives.

TECHNICAL SKILLS

- **Languages & Frameworks:** Java, Spring Boot, Spring Cloud, Microservices, Spring MVC, Spring Security, Hibernate, JPA, RESTful APIs
- **Messaging & Event Streaming:** Apache Kafka, RabbitMQ
- **Testing:** JUnit 5, Mockito
- **Databases:** SQL, MySQL, PostgreSQL, MongoDB
- **Tools:** Git, GitHub, Jira, Maven, Postman, Swagger

WORK EXPERIENCE

ASSOCIATE JAVA DEVELOPER

January 2023 – Present

CYBROWSE DIGITAL SOLUTIONS PRIVATE LIMITED, Hyderabad

PROJECT: S-100 Hydrographic Data Exchange and Management System

April 2024 – Present

Tech Stack: Java 17, Spring Boot 3.x, Spring Security (JWT), Hibernate, PostgreSQL, Spring Cloud (OpenFeign, Gateway, Config Server, Resilience4j, Eureka), JUnit 5, Mockito, Swagger (OpenAPI), Postman

Description: Developed a secure, web-based system for managing and packaging S-100 hydrographic exchange sets in compliance with International Hydrographic Organisation (IHO) standards. The platform supports creation, validation, digital signing, and packaging of geospatial datasets, ensuring data integrity, authenticity, and adherence to maritime data exchange protocols.

Key Contributions:

- Designed and implemented independent Spring Boot microservices for dataset management, metadata validation, and packaging workflows with clear modular boundaries.
- Established inter-service communication using Spring Cloud OpenFeign and RESTful APIs for seamless data exchange between microservices.
- Configured Spring Cloud Config Server for centralised configuration management across services.
- Integrated Spring Cloud Gateway as an API Gateway to route external client requests securely to internal microservices and handle authentication, routing, and filtering.
- Applied Resilience4j (Circuit Breaker, Retry, and Fallback) for fault tolerance and graceful service degradation during network or service failures.
- Implemented Eureka Service Discovery for dynamic service registration and client-side load balancing (Ribbon) to distribute requests efficiently.
- Secured all microservices using Spring Security (JWT Authentication and Role-Based Authorisation) to protect APIs and enforce user access control.
- Built digital signing and validation modules to ensure the integrity and authenticity of datasets during exchange set creation.
- Applied Global Exception Handling and centralised logging with Spring Sleuth and Zipkin for traceability and observability across microservices.
- Followed Test-Driven Development (TDD) and performed unit and integration testing using JUnit 5 and Mockito, achieving high test coverage.
- Documented APIs using Swagger (OpenAPI) and validated REST endpoints with Postman during integration testing.
- Contributed to system design discussions (C4 Model) focusing on scalability, maintainability, and service isolation principles.
- Manage code versions with Git and GitHub, track tasks and progress using Jira, and actively participate in Agile/Scrum ceremonies such as sprint planning, stand-ups, reviews, and retrospectives.

PROJECT: CTCP –| Trade Finance Complaint Management System

June 2023 – April 2024

Tech Stack: Java 17, Spring Boot 3.x, Spring Security (JWT), Hibernate, MySQL, Spring Cloud (OpenFeign, Gateway, Config Server, Resilience4j, Eureka), JUnit 5, Mockito, Swagger (OpenAPI), Postman

Description: Developed and enhanced a microservices-based Trade Finance Complaint Management System for a Canadian client to streamline dispute handling and resolution for Letters of Credit (LCs), remittances, and bill discounting. The platform improved traceability, turnaround efficiency, and data reliability across multiple trade-finance workflows.

Key Contributions:

- Designed and implemented two core microservices:
- Complaint Service – responsible for complaint registration, tracking, and resolution workflows.
- Transaction Service – handled trade transaction details, remittance data, and escalation triggers.
- Enabled inter-service communication between microservices using Spring Cloud OpenFeign, ensuring reliable data exchange.
- Integrated Spring Cloud Gateway as a unified API entry point for routing, authentication, and traffic management.
- Configured Spring Cloud Config Server for centralised property management across both services.
- Applied Resilience4j (Circuit Breaker and Retry) to enhance service reliability during downtime or latency spikes.
- Used Eureka Service Registry for dynamic service discovery and client-side load balancing.
- Secured REST endpoints with Spring Security (JWT Authentication and Role-Based Access Control) to protect internal and external workflows.
- Optimised MySQL database queries and schema for transactional consistency and faster data retrieval in high-load scenarios.
- Implemented asynchronous REST calls for background complaint status updates and escalation notifications.

EDUCATION

Bachelor of Science in Computer Science,
Krishna University, Kanumolu, Andhra Pradesh
